

# VersaIMAGE™ products to create Distribution CDs

## VersaIMAGE Single User or Network version

- **VersaIMAGE** interfaces with ISIS compatible film and paper scanners. Paper scanners may be single sided or duplex (both sides), slow or high speed, with or without batch control cards. VersaIMAGE contains an extensive paper scanner image management module for single, batch, rescan, QC and indexing functions. VersaIMAGE interfaces also with standard microfilm cameras, with or without Bar Code capabilities.
- **VersaIMAGE** offers manual or fully automatic microfilm scanning/printing with automatic electronic file folder generation for indexed blips or image marks. VersaIMAGE *automatically creates electronic file folders* on multi-level, blipped microfilm with automatic insertion of scanned images into appropriate new electronic folders. Scanned images may easily be written to CD-R for image distribution purposes via the VersaIMAGE CD pre-mastering software module. For bank applications VersaIMAGE offers “check-stacking” combining front and back of selected check images in a single image.
- **VersaIMAGE** contains universal CAR microfilm management. VersaIMAGE drives virtually all competitive automatic microfilm retrieval controllers on the market today. A unique “drop-down” computer screen controller keyboard offers customary microfilm retrieval and scanning functions! With the use of microfilm scanners one may limit microfilm retrievals to one-time only events. A microfilm scanner must scan all images first before it can display, fax, email or print images. All such scanned images may then be stored and cross-referenced automatically in the VersaIMAGE database. Thus VersaIMAGE allows continued conversion of film images to digital images in normal daily use. Additionally, VersaIMAGE’s *automatic film conversion mode converts entire rolls or sections of microfilm to digital, often distributed images!*

## VersaIMAGE 32 Platinum SQL version

Client-Server database, requires MS SQL 7.0 Supports all VersaCAR and versalIMAGE features including multiple databases, film readers and cameras, data and image import/export, lookup append, email, batch and roll scanning, multiple indexing modes, CD pre-mastering, bar code, OCR zone read, roll film sort, high power crop and image correction module.
